Θέμα 1:

a) $f(z) = u(x, y) + i v(x, y)$

$$u(x, y) = 2(2 \sinh x \sin y + xy), \quad f(0) = 3$$

$f(z)$ ολόμορφη $\Rightarrow$ ικανοποιούνται οι γνωστές

Cauchy-Riemann $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$

$$\frac{\partial u}{\partial x} = 4 \sin y \cosh x + 2y = \frac{\partial v}{\partial y}$$

$$\Rightarrow v = 4 \cosh x (-\cos y) + y^2 + a(x) \quad (1)$$

$$\frac{\partial u}{\partial y} = 4 \sinh x \cdot \cos y + 2x = -\frac{\partial v}{\partial x} \quad (2)$$

Παραγωγίζουμε την (1) ως προς x

$$\Rightarrow \frac{\partial v}{\partial x} = 4 \sinh x (-\cos y) + a'(x) \quad (3)$$

$$(2) = (3) \Rightarrow -4 \sinh x \cos y - 2x = -4 \sinh x \cos y + a'(x)$$

$$\Rightarrow a'(x) = -2x \Rightarrow \boxed{a(x) = -x^2}$$

Άρα $f(z) = 2(2 \sinh x \sin y + xy) + i(-4 \cosh x \cos y + y^2 - x^2)$
